IN THIS ISSUE

When the Bombs Hit the Cloud: The AWS Middle East Strikes
The AI Delivery Bottleneck
The Leadership Read • Outside In • On the Radar
The AI Coding Revolution Nobody Planned For
Revolut Gets Its Full UK Banking Licence

FOREWORD

Drones hit cloud infrastructure and 109 services went dark for weeks. AI coding tools reached 95% weekly adoption while delivery pipelines buckled under the weight of code nobody can ship fast enough. A neobank gained the same regulatory standing as Barclays. This is the month the assumptions broke — about resilience, about productivity, and about who the competition really is.

THE MONTH AT A GLANCE

Eight stories in sixty seconds

⚠ ACTION REQUIRED

AWS **Iranian drone strikes hit 3 AWS facilities in UAE and Bahrain** (Mar 1) — 109+ services offline, 2/3 UAE AZs down. 16+ days without full restoration. AWS recommends migrating ME workloads. *See lead article below.*

Security **Chrome zero-days patched** (Mar 13) — CVE-2026-3909 and CVE-2026-3910 exploited in the wild. Update immediately. *The Hacker News*

Node **Node.js 20 EOL April 30** — 24.14.0 LTS released (Mar 11). New release schedule: one major per year from Node 27. Migration should be underway. *nodejs.org*

WORTH KNOWING

AI **Claude Code is the #1 AI coding tool** — Pragmatic Engineer survey: 95% weekly AI usage, Claude Code overtook Copilot and Cursor in 8 months. *See Article 2.*

Banking **Revolut secured its full UK banking licence** (Mar 11) — FSCS-protected deposits for 13M customers. Credit products and dual London/NY IPO ahead. *See Article 4.*

DevEx **CircleCI: throughput up 59%, but delivery is slowing** — main branch success at 70.8% (5-year low). Fewer than 1 in 20 teams shipping at AI speed. *See Article 3.*

WATCHING

AI **Microsoft Copilot Wave 3 launches May 1 with Claude** — Agent 365 at $15/user, E7 Frontier Suite at $99/user. Anthropic's Cowork technology in mainline Copilot. *Windows Central*

Regulati **EU AI Act high-risk obligations apply August 2, 2026** — organisations deploying AI in hiring, credit scoring, or critical infrastructure must comply. Planning window is narrowing.

PRIORITY 0 • CLOUD & INFRASTRUCTURE

When the Bombs Hit the Cloud: The AWS Middle East Strikes

109+	3	2 of 3	16+
SERVICES AFFECTED	FACILITIES HIT	UAE AZS OFFLINE	DAYS RECOVERY

On March 1, Iranian drone strikes hit two AWS data centres in the UAE and damaged a third in Bahrain. Two of three availability zones in the UAE went offline — not degraded, offline. 109+ AWS services became unavailable. The physical damage was severe: structural, power, fire, and water damage from suppression systems. AWS initially described "objects" causing a "localized power issue," then confirmed the strikes 36 hours later.

The banking impact was immediate. ADCB mobile banking went down. Emirates NBD was disrupted. Payment platforms Alaan and Hubpay stopped processing. Careem — the region's dominant ride-hailing app — was disrupted. The effects cascaded beyond the Middle East: US-EAST-1 experienced degraded

Context: What is multi-AZ?

AWS regions contain multiple Availability Zones (AZs) — physically separate data centres within the same geographic area. Multi-AZ deployment spreads workloads across 2–3 AZs so that if one fails, the others keep running. The assumption: AZs fail independently through hardware faults, power issues, or network problems. That assumption was designed for technical failures, not military

performance, Snowflake reported service issues, and Claude AI saw availability problems. As of mid-March, more than 16 days after the strikes, there was no full restoration date. AWS's recommendation to customers was extraordinary: migrate your workloads to alternate regions.

The data residency paradox

UAE and Bahrain Central Bank mandates require financial data to stay in-region. The region's infrastructure was physically destroyed. Failing over to another region resolves the outage but creates a legal problem — you can't comply with data residency requirements when the region doesn't exist in a functional sense. The Dubai Financial Services Authority issued emergency guidance for temporary cross-region processing, a regulatory improvisation nobody had planned for.

Multi-AZ redundancy within a single region — the standard resilience playbook — assumed that availability zones fail independently through technical faults, not simultaneously through military action. That assumption is broken. For any organisation running production workloads in a geopolitically contested region, the conversation has shifted from "how many AZs?" to "how many *regions*?" — and what happens to your compliance posture when you can't use the one the regulator requires.

strikes that damage multiple facilities simultaneously.

Cascading impact

The strikes didn't stay contained to the Middle East. US-EAST-1 experienced degraded performance. Snowflake reported service issues. Claude AI saw availability problems. $300 billion in Gulf AI and data centre investments are now at risk.

KEY TAKEAWAYS

→ Multi-AZ ≠ multi-region. Simultaneous AZ failure from physical attack was not in most DR plans.

→ Data residency mandates and disaster recovery are now in direct conflict in contested regions.

→ AWS's advice to migrate workloads is unprecedented — and signals long-term uncertainty for the ME region.

→ Cascading failures to US-EAST-1, Snowflake, and Claude AI show interconnection risks beyond the strike zone.

Sources: CNBC, The Register, Reuters, Data Center Knowledge, Marketplace

This is the first major military strike on hyperscale cloud infrastructure. Data centres are now military targets, and $300 billion in Gulf AI and data centre investments are at risk.

AI & TOOLING

The AI Coding Revolution Nobody Planned For

The Pragmatic Engineer's March survey of 906 engineers is definitive: 95% use AI tools weekly, 75% for half or more of their work, 55% use agents regularly. Claude Code is the #1 most-used AI coding tool — overtaking Copilot and Cursor in just eight months since its May 2025 launch. It commands 46% of "most loved" mentions.

95% WEEKLY AI USAGE	**46%** CLAUDE CODE "MOST LOVED"
55% USE AGENTS REGULARLY	**-13%** IBM SHARES (COBOL THREAT)

Anthropic's disruption goes beyond coding tools. Their COBOL modernisation capability caused IBM shares to drop 13% on February 23. The $100M Claude Partner Network launched March 12 with Claude Certified Architect training. Meanwhile, Microsoft is integrating Claude into Copilot Wave 3 (March 10), with Agent 365 launching May 1 at $15/user and the E7 Frontier Suite at $99/user.

The question for engineering leaders: your teams are already saturated with AI tools. The contest now is over who controls the agent layer — and whether your procurement decisions match what your engineers actually want to use.

DEVELOPER EXPERIENCE & PRODUCTIVITY

The AI Delivery Bottleneck

70.8%

Main branch success rate — lowest in five years (benchmark: 90%)

CircleCI's 2026 State of Software Delivery report — 28 million CI/CD workflows analysed — reveals the paradox at the heart of the AI coding boom. Average throughput jumped 59% year-over-year, the biggest increase ever. But on the main branch, where code actually ships, delivery throughput for the median team fell 7%.

Recovery times are up 13% to 72 minutes. Feature branch throughput is up 15% for the median team, meaning more work-in-progress piling up in branches that don't make it to production.

The distribution is stark. The top 5% of teams saw throughput jump 97%. The median got 4%. The bottom quartile got nothing. AI is amplifying existing delivery strengths, not distributing them evenly. Writing code is no longer the constraint — review, validation, and integration is where it all piles up.

BANKING & FINTECH

Revolut Gets Its Full UK Banking Licence

13M	$75B	£3B	£120K
UK CUSTOMERS	VALUATION	UK INVESTMENT PLANNED	FSCS PROTECTION

After a four-year application process and 18 months in mobilisation, the PRA lifted restrictions on March 11 and Revolut Bank UK Ltd became a fully licensed bank. Eligible deposits are now FSCS-protected up to £120,000 — the same safety net customers get at Barclays or HSBC. This is the moment the fintech narrative shifts from "challenger nibbling at margins" to "direct competitor with regulatory parity."

The licence unlocks lending and credit products — the real revenue engines of banking, locked behind full authorisation until now. Current accounts are rolling out gradually to new customers; existing customers remain on the e-money entity, with migration over months. Revolut has committed £3 billion to UK investment and 1,000 high-skilled jobs. They're also exploring a dual London/New York IPO at their $75 billion valuation. The Bank of England governor reportedly blocked a chancellor-arranged meeting over political interference concerns — a signal of how seriously the establishment takes this.

For anyone building payment infrastructure or customer-facing banking technology in the UK: this is a competitor with 13 million customers that just gained the full platform to offer lending, credit, and protected deposits — powered by an engineering-led operating model traditional banks cannot replicate without rebuilding from scratch.

OTHER NEWS THIS MONTH

In Brief

PMI and Agile Alliance released the Manifesto for Enterprise Agility (Mar 3) — first joint manifesto, extending agile from team delivery to enterprise governance, funding, and leadership. *PMI, Agile Alliance*

Anthropic discovered 24,000+ fraudulent accounts from Chinese AI labs — DeepSeek, Moonshot, and MiniMax systematically scraping Claude capabilities. *Mean CEO Blog*

MCP security concerns mounting — RSA Conference 2026 submissions heavily focused on Model Context Protocol risks. The attack surface of agentic AI is becoming a first-class security concern. *CIO*

UK open banking heading toward open finance — FCA expects VRP live transactions in Q1, statutory instrument for new regulatory framework expected 2026. *Open Banking UK*

March Patch Tuesday: 79 CVEs, 2 zero-days — SQL Server elevation of privilege and .NET denial of service both exploited. *BleepingComputer*

PLATFORM UPDATES

At a Glance

PLATFORM	WHAT CHANGED
.NET	March security patches across .NET 10/9/8. Emergency .NET 10.0.5 out-of-band fix for macOS debugging (Mar 12).
Node.js	24.14.0 LTS (Mar 11). Node 20 EOL April 30 — migration should be underway. New release schedule: one major per year from Node 27.
GitHub	Copilot agentic capabilities GA in JetBrains. VS 2026 18.3.0 with Copilot memories. AGENTS.md instruction file support.
AWS	S3 turned 20. Route 53 Global Resolver GA. Stateful MCP in Bedrock AgentCore. ME region recovery ongoing.

THE LEADERSHIP READ

Agentic Engineering in Practice: What the Pragmatic Summit Told Us

Simon Willison — creator of Datasette and one of the most respected voices in AI-assisted development — sat down for a fireside chat at Gergely Orosz's Pragmatic Summit in San Francisco. Published March 14. It's the most useful thing released this month for anyone managing an engineering team that uses AI tools.

The adoption curve is real — and your people are at different points on it

Willison described distinct phases: ChatGPT for occasional questions, then AI agents writing bits of code, then agents producing more code than the human. The newest phase — where Willison operates now — is where "you don't read the code." The agent writes it, runs it, tests it, and you evaluate the output. Understanding where each person on your team sits on this curve matters, because they need fundamentally different support at each stage.

TDD becomes essential, not optional

"Every single coding session I start with an agent, I start by saying here's how to run the test." When AI writes the code, tests become the specification language — the mechanism through which you verify the agent did what you intended. Teams without strong test coverage are flying blind with agents.

Mental exhaustion is the new bottleneck

> *After two hours of that I'm done for the day. I'm mentally exhausted. People worry about skill atrophy and being lazy. I think this is the opposite of that. You have to operate firing on all cylinders if you're going to keep your trio or quadruple of agents busy solving all these different problems.*
>
> — Simon Willison, Pragmatic Summit, 2026

Running 3–4 agent sessions in parallel is technically possible but cognitively draining. Two hours of high-intensity agent orchestration can outproduce a full day of traditional development. The engineers using AI most effectively may look like they're working less. Traditional productivity metrics are becoming meaningless.

Maintain a "retry list"

Keep track of tasks that AI failed at and re-test every six months as models improve. Willison describes regularly being surprised when something impossible three months ago now works perfectly. The teams that systematically re-test their assumptions will find capabilities others miss.

What this means for management

Productivity measurement needs rethinking. Team practices must account for cognitive intensity. Tooling investment is becoming as important as headcount. The engineers leaning furthest into agents aren't the ones who need less attention — they're navigating the steepest learning curve and operating at the highest cognitive load.

OUTSIDE IN

What Monzo Expects From Its Engineering Managers

A UK neobank's public framework for EM accountability

Monzo published a detailed breakdown of what it expects from engineering managers — written not as an HR document, but as a direct letter from a senior engineering manager to the people reporting to them. It's one of the most transparent articulations of EM accountability published by a UK financial services company, and several of the principles translate directly to any engineering organisation scaling beyond a handful of teams.

The operating model

The framework is built around a clear contract: "You drive, and I'll provide support." EMs at Monzo own their area's outcomes — technical strategy, roadmap influence, delivery commitments, and team growth — with their manager acting as a coach, not a decision-maker. Performance is measured on business impact, not process adherence. The explicit statement that "not all your bets need to be winners" signals a tolerance for intelligent risk-taking that many banking environments struggle to articulate.

Two expectations stand out. First, EMs are accountable for technical outcomes but explicitly told not to write code: "There's no expectation that you will write code alongside your team to deliver business impact." Instead, the focus is on building a leadership bench — developing senior engineers who can own technical direction so the manager becomes a multiplier rather than a bottleneck. Second, the prioritisation hierarchy is stated bluntly: "Think company > collective > team > individual (including yourself)." Local team optimisation at the expense of the wider organisation is treated as a failure mode, not a success.

Why this matters beyond Monzo

Most engineering organisations have implicit expectations for their managers that nobody has written down. Monzo has made theirs public — including the uncomfortable parts about incident management ("we're hard on problems and not on people"), the requirement that bad news flows faster than good news, and the expectation that EMs run meetings with purpose, agendas, and owned actions. For any engineering leader building or refining their own management framework, this is a concrete reference point from a company operating regulated financial services at scale.

ON THE RADAR

What's Coming

DEADLINES & REQUIRED ACTIONS

April 19	Claude Haiku 3 model retirement — migrate to Haiku 4.5
April 30	Node.js 20 end of life — migration to v24 recommended

August 2	EU AI Act — high-risk AI obligations take effect. Conformity assessments, CE marking, and EU database registration required.

EVENTS & CONFERENCES

April 22	AWS Summit London — expect Bedrock, Trainium, and ME recovery announcements
April 29	Zero Day Con, Dublin — Ireland's largest cybersecurity conference
May 1	Microsoft Copilot Wave 3 / Agent 365 launch ($15/user)
